4

Ability to associate a particular LLM model to this specific Git Worktree.

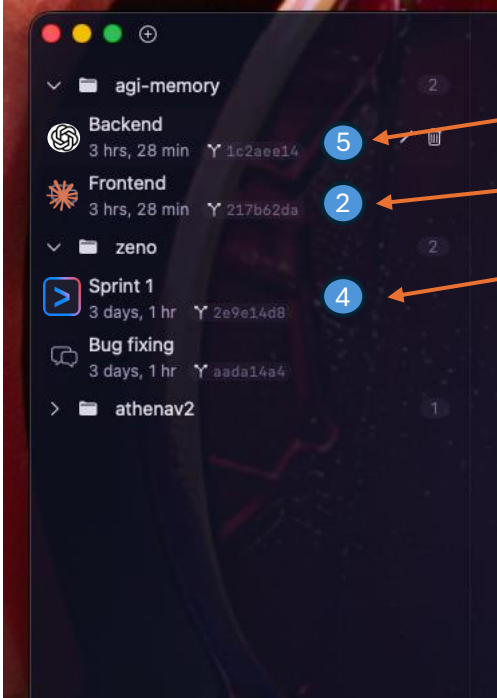

Provider selector (dropdown):

- OpenAI
- Anthropic
- Google

Model selector:

- Codex 5.2 (medium, high, xhigh)
- Claude (Opus 4.5, Sonnet 4.5, Haiku 4.5)
- Gemini 3.0 Flash, 3.0 pro etc.

Added Features

Since different worktrees could have multiple terminals and chats occurring concurrently, this is a notification system to alert the user that there are actions to be taken (either in chat, or terminal outputs) This will enable the user to be better aware and work across multiple worktrees in parallel.

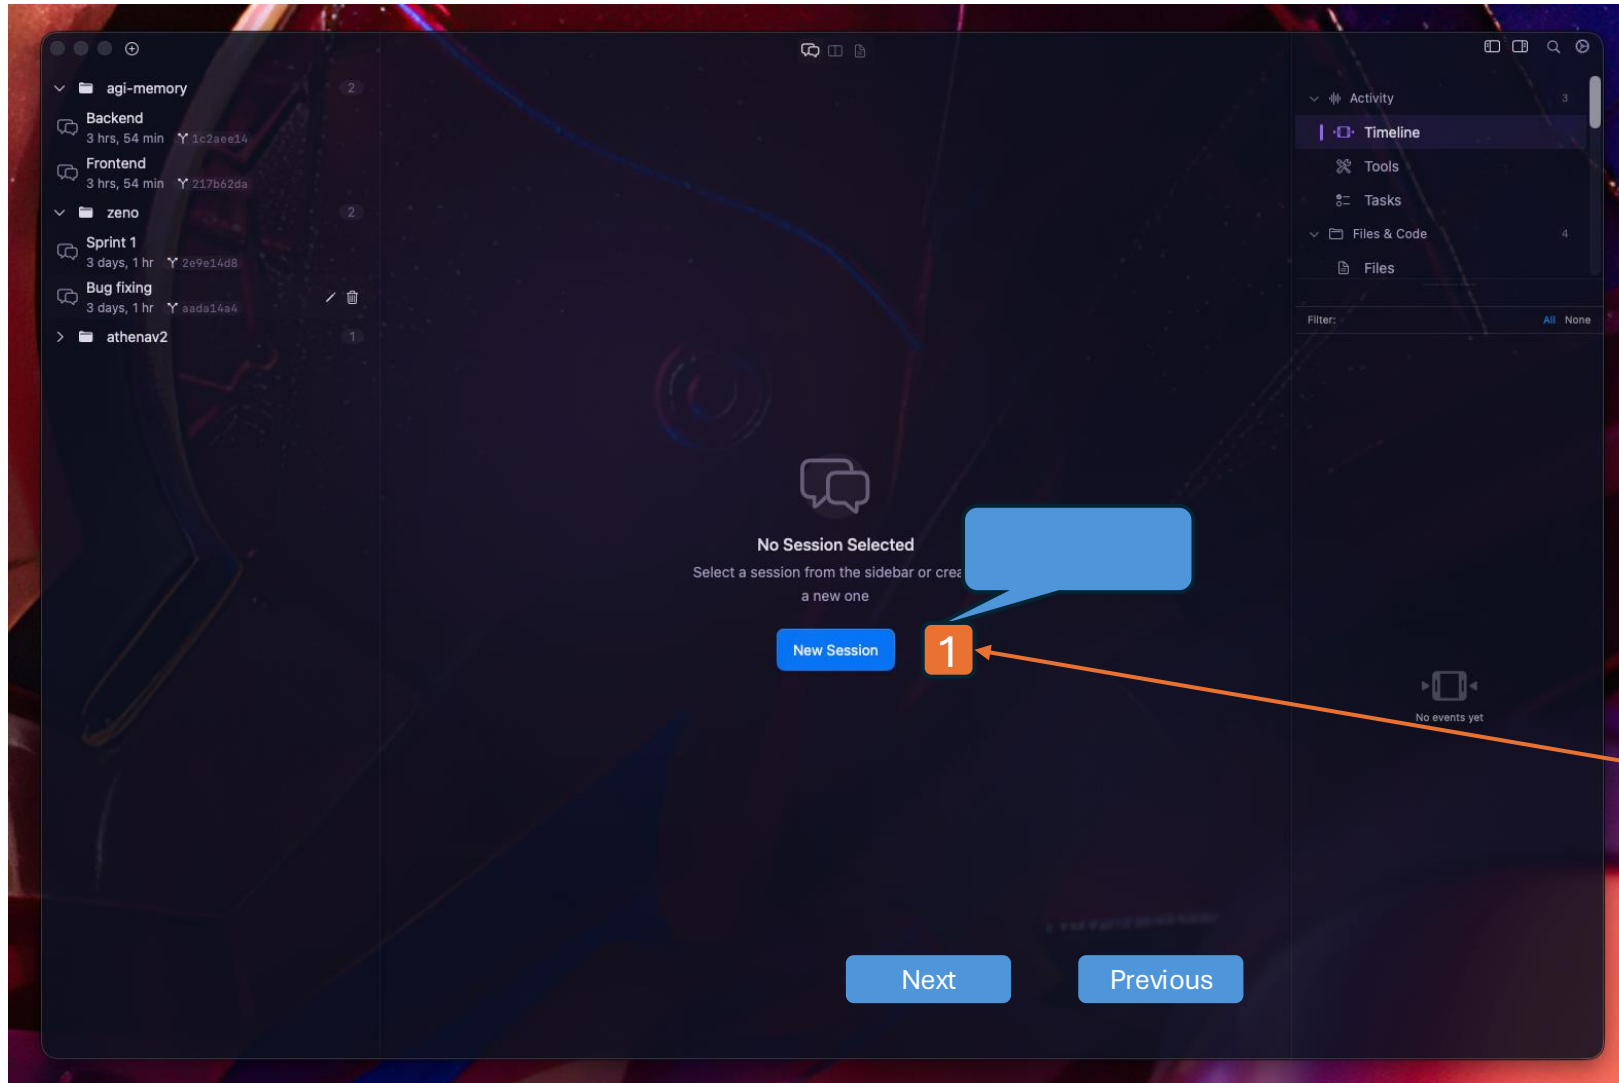

To make the user more aware of what worktree is running which CLI / LLM, we will put logos of the CLI vendors, making it easier to identify.

First Launch / Onboarding Workflow

- Screen 1: User should be greeted with a welcome message. Very stylish with light animation and motion.
- Screen 2: User to enter their first and last name and input their email. The user will have the option to skip. Tooltips will explain that this is to customize the experience better for the user. (For subsequent launches, the user will be greeted with a welcome screen (first name, last name,) which disappears after 3 seconds)
- Screen 3: The app will scan the mac to see if the following CLI's are already installed:
 - OpenAI – Codex CLI
 - Anthropic – Claude Code CLI
 - Google – Gemini CLI
 - If not, then there will be a button enabling the users to install the CLIs.
 - There will be tooltips espousing the strengths of each CLI and recommending that ALL CLI's are installed
- Screen 4: Recommendations for Installation of Skills (from skills database)
- Screen 5: Recommendations for Installations of Plugins (broken down by CLI). Plugins may be CLI specific.
- Screen 6: Recommendations for Installation of Additional Agents (downloaded from agents database)
- Screen 7: Onboarding ends. Users can decide to close menu (button) or continue to tutorial (button).

Tutorial Mode

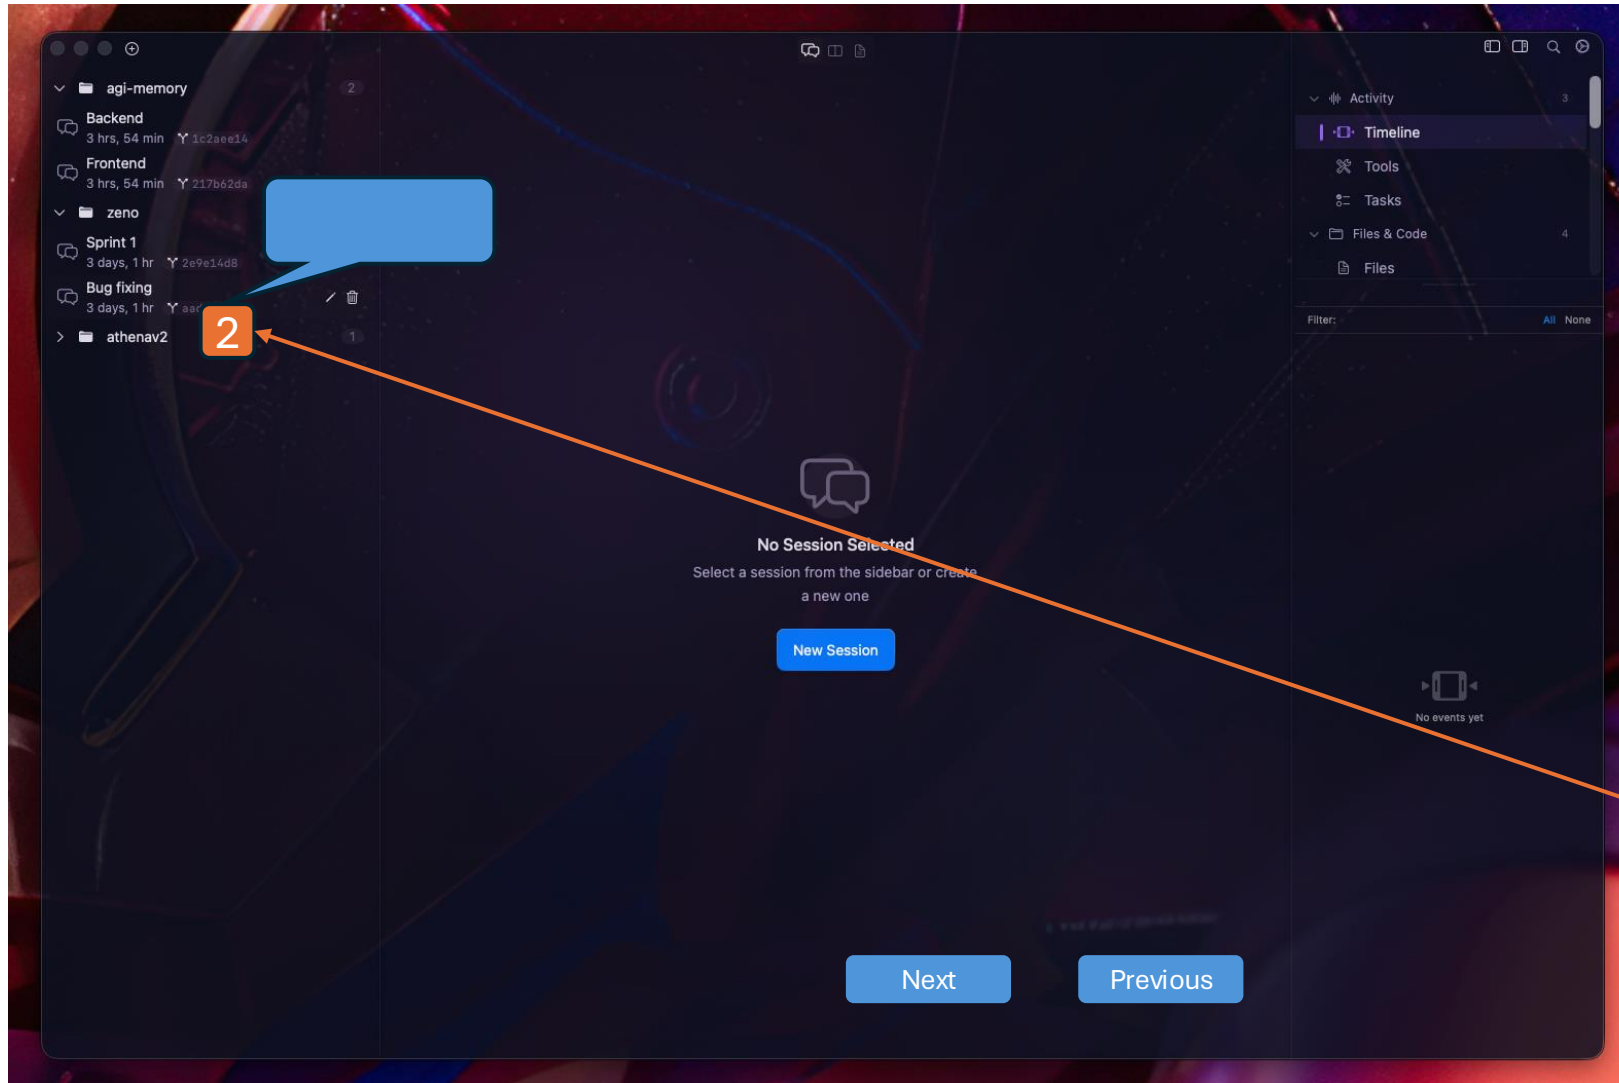

Should have clouds with callouts.

Explains functions to familiarize users.

User has ability to cycle using the next and previous buttons

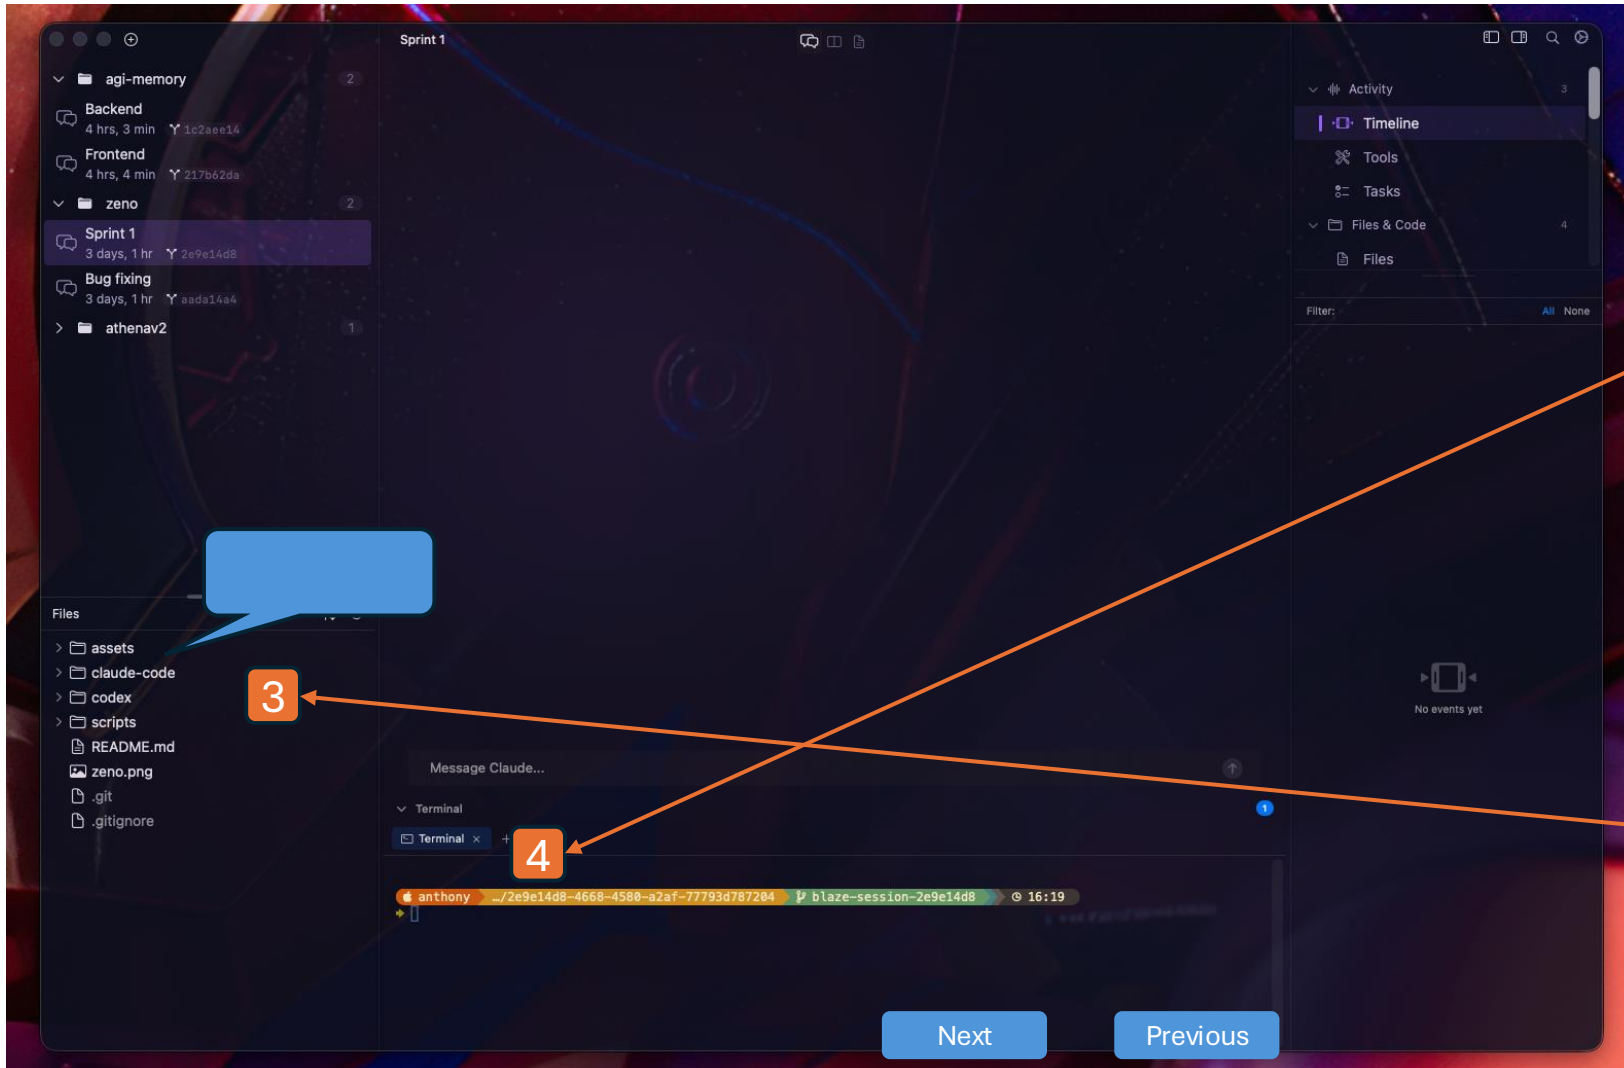

Area 1 covered is how to create a session

Tutorial Mode

Area 2 covered is on how to manage git worktrees and how to use them to maximal effectiveness

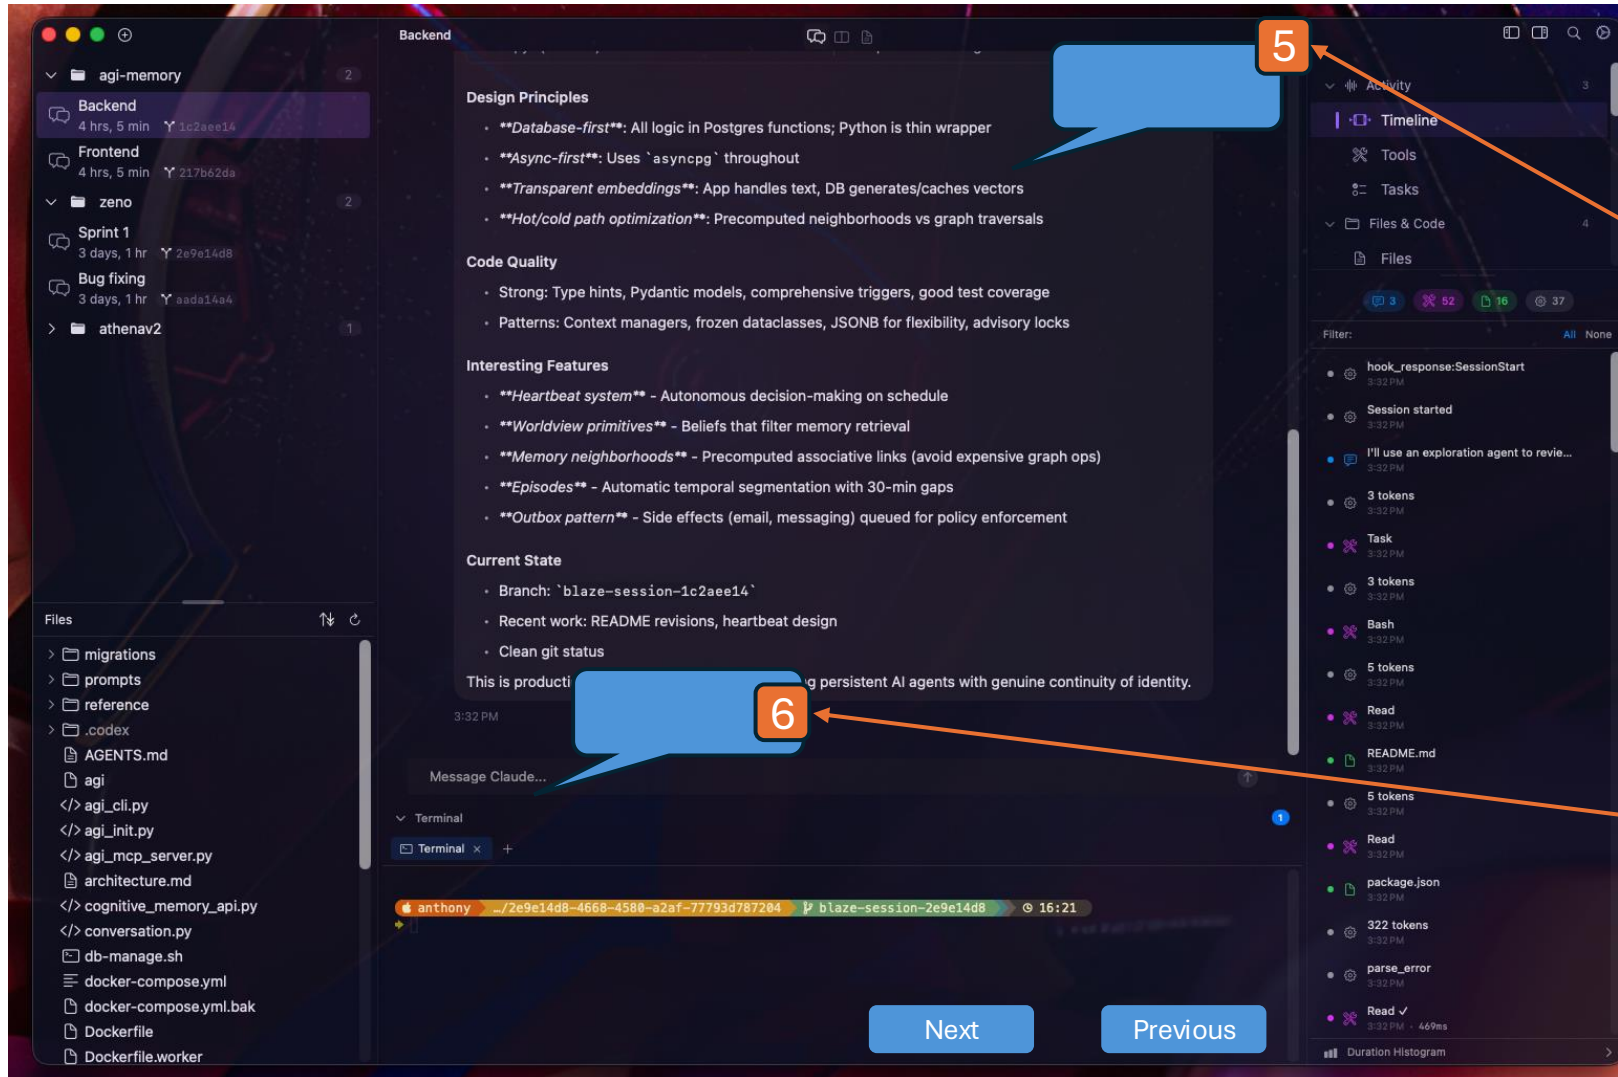

Tutorial Mode

Area 4 covers how to use the terminal

Area 3 covered is on how to use the file tree

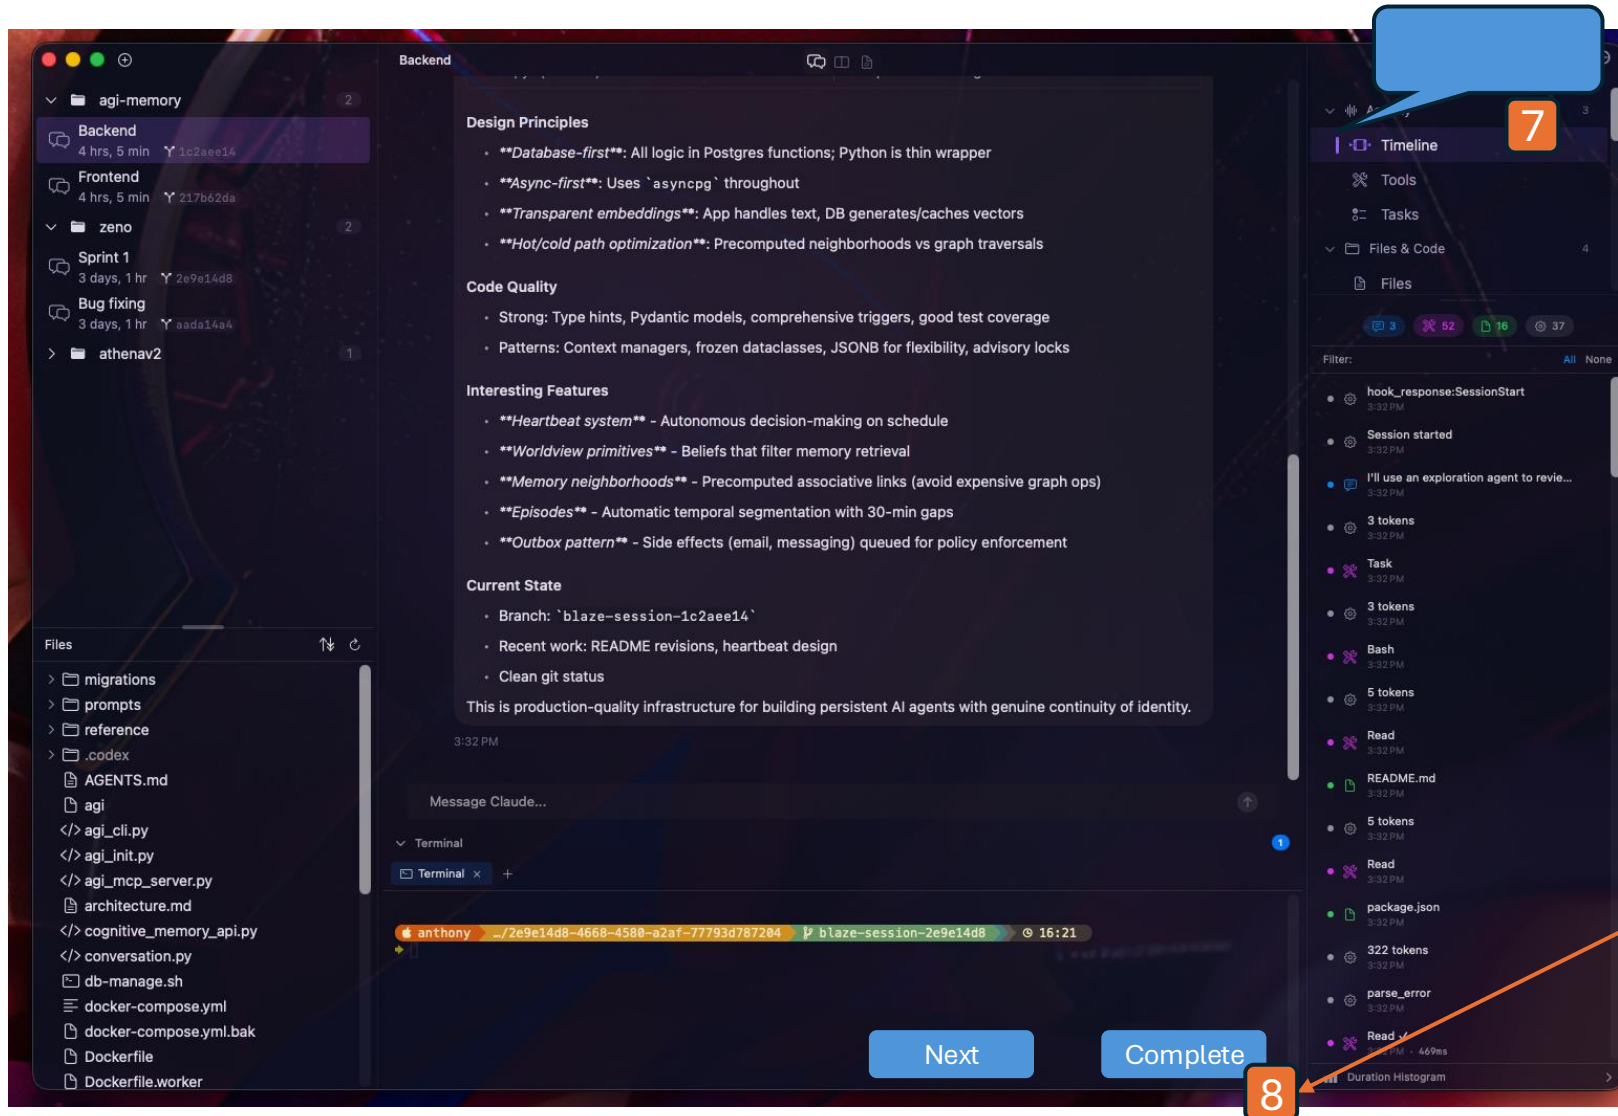

Tutorial Mode

Area 5 covers the chat area

Area 6 covers the chat input area

Tutorial Mode

Area 7 covers the right side panel. Since there are a lot of features here, the focus will be on “Timeline”, “Tool”, “Tasks”, “Tokens”, “Hooks”,

User can click to Complete the tutorial
